2. Screened Assembly QC Results

GC vs coverage based on GC of NCBI nt and Greengenes 16S rRNA gene hits to the assembly using megablast, shown for different taxonomic levels.

No hits found.

Estimated genome recovery derived from analysis of universal single-copy genes detected in final assembly.

Coverage vs GC. Scaffolds were shredded into non-overlapping 5 kb fragments and the GC of each shred was plotted as a point, colored by scaffold id. Coverage was calculated by mapping the fragment library to the final assembly and plotted as connected points.

GC histogram of the contigs, including contig length weighted distribution.

Principal component analysis of tetramer frequencies of contigs. Detectable variations are highlighted in color.

Insufficient number of contigs with length ≥ 2000 bp. Minimum number required is 10 to run tetramer analysis.
