

HF PWG Weekly Meeting

High Pt NPE analysis on P+P Run2012
@200Gev

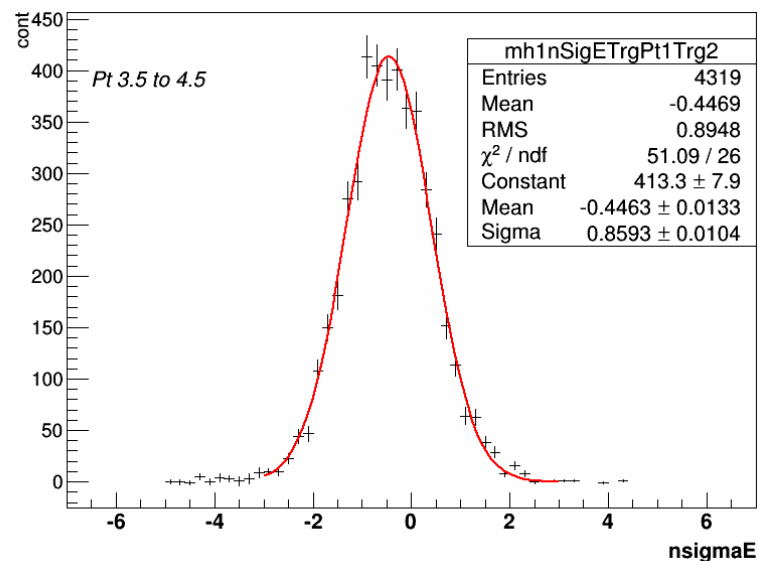

Xiaozhi Bai Mustafa Zhenyu Ye

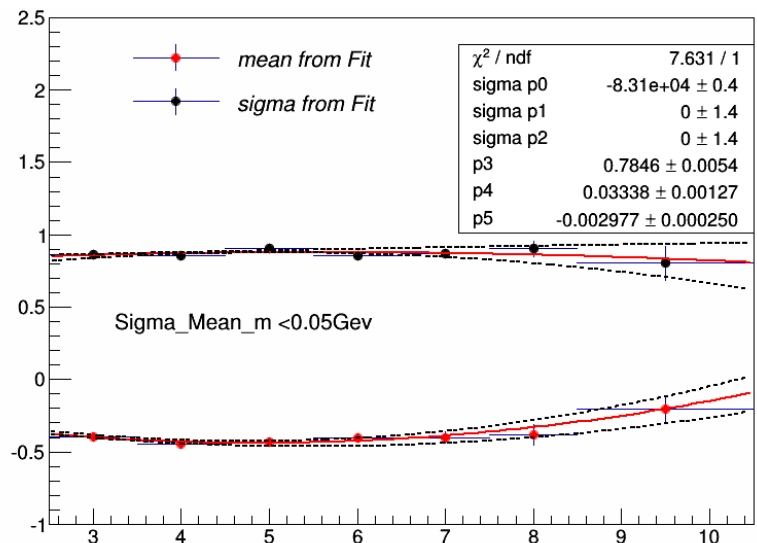

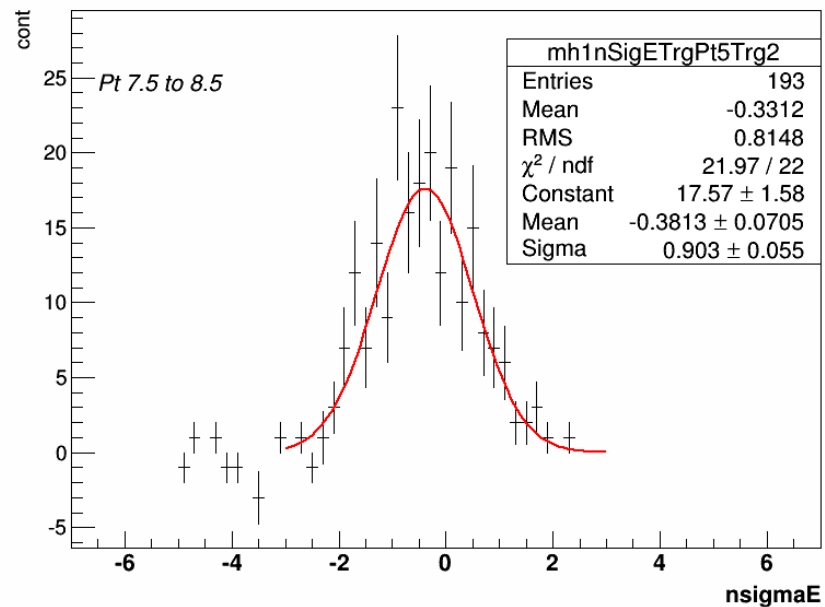

1/06/2014

Outline

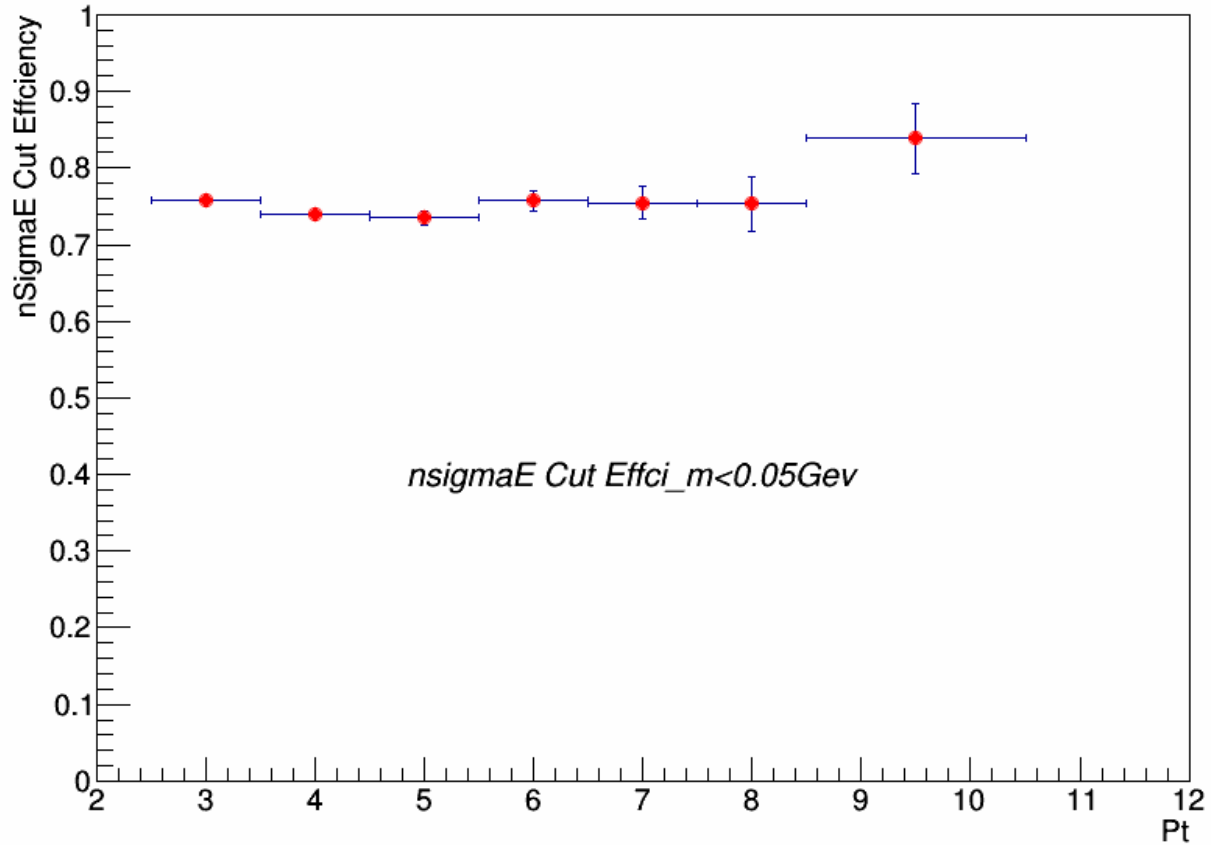

- nsigmaElectron cut efficiency
- The calibration of the electron from the photonic electron
- Calculate the purity of the inclusive electron and uncertainty
- EMC cut efficiency

The gaussian fit of the photo electron in different Pt bin

nSigmaElectron cut efficiency ($-1 < n\sigma_E < 3$)

The purity of the inclusive electron

Inclusive electron sample the pion and kaon and proton are included, but we don't have the calibration of the hadron. There are two Gaussian fit, one is for hadron and the other is for the electron

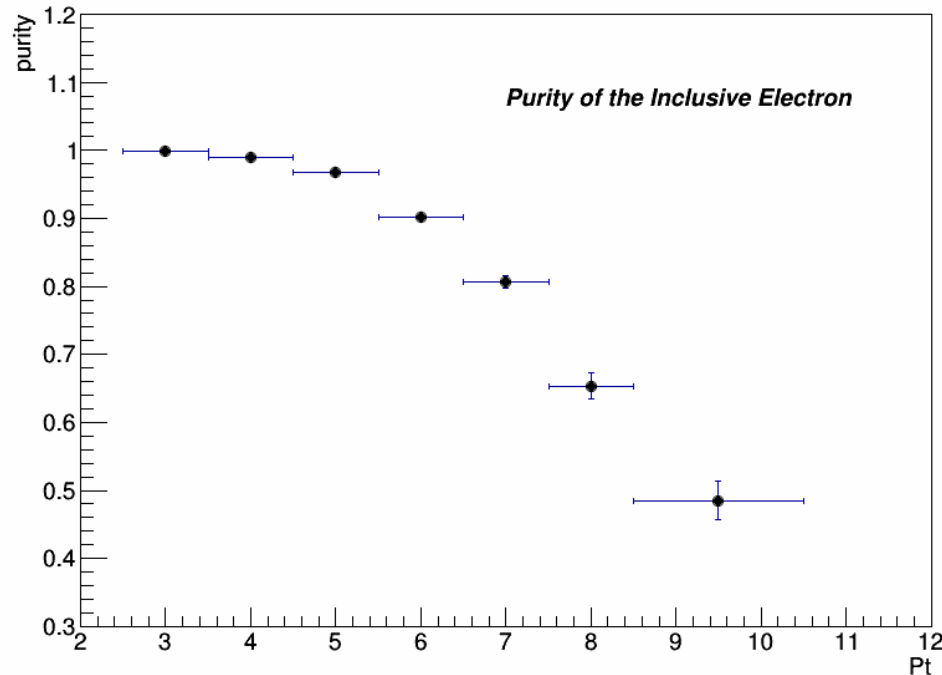

Red: hadron Blue: Inclusive electron Green: electron

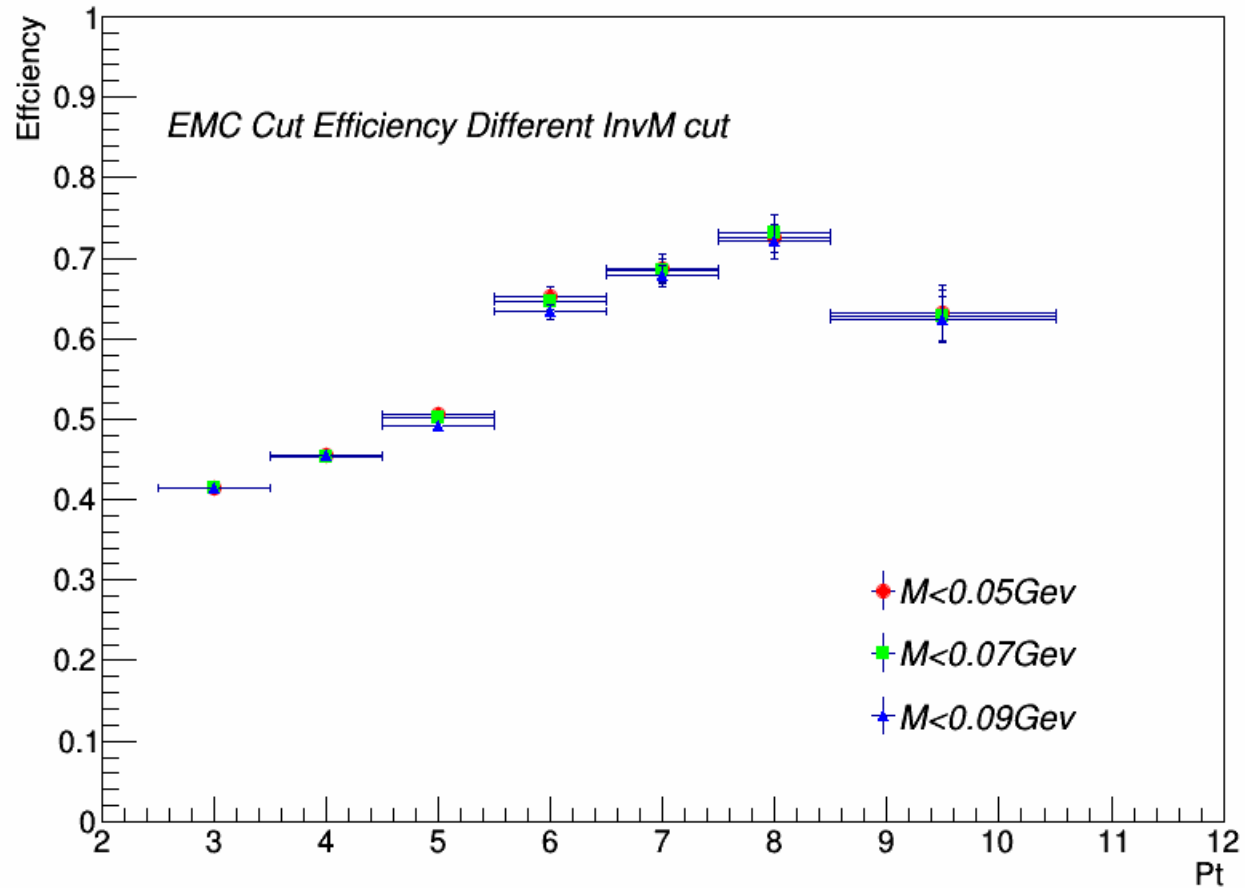

The purity of the inclusive electron in different pt bin (one sigma constrain)

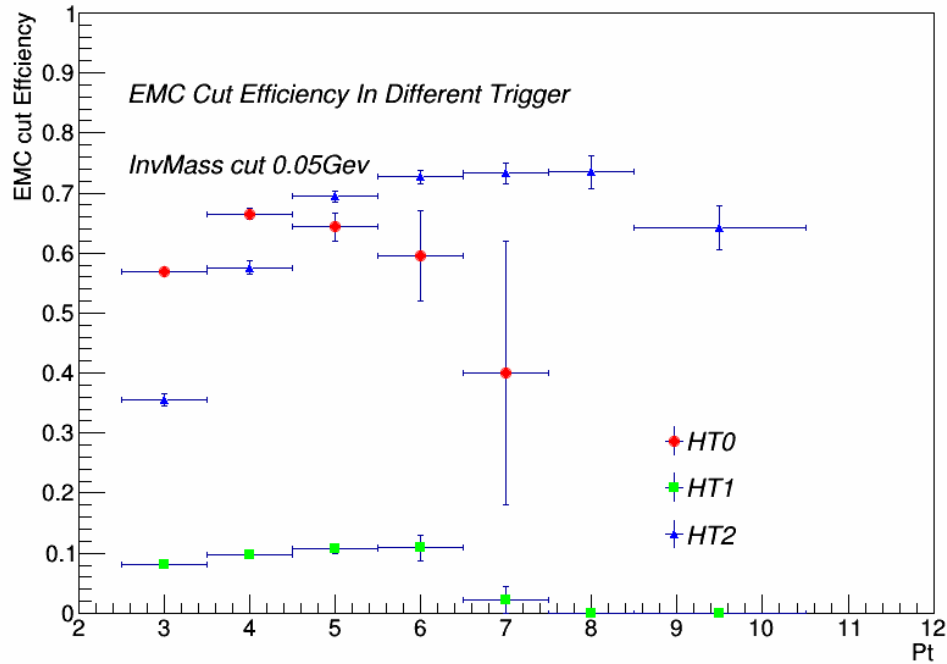

The purity and systematic uncertainty

EMC cut efficiency in different InvMass cut

EMC Cut Efficiency In Different Trigger

Why the HT1 EMC cut efficiency is lower than HT0 and HT2?(because of the $N_{eta}>1$ && $N_{phi}>1$) The study of this problem is on going

NEta and NPhi distribution

(All the ePID cuts applied except Neta & NPhi)

NETa

NPhi

Thanks

Track Quality Cuts and eID Cuts

- Track quality cuts:
nhits>20 && nhits/nhist_poss >0.52
&& nhitsDedx >15 && gDCA<1.5 && first_pointR <73
- eID Cuts
pMom> 0.2 && |eta|<1.0 && nEta >1 && nPhi>1
&& ((HT0BBCMBTof0 && ADC> 11) || (HT1BBCMBTof0 &&
ADC>15) || (TH2BBCMB && ADC >18))
&& 0.3<poe0<1.5 && |Dz|<3 && |Dphi| <0.015 && -1<nσe<3
- Partner cuts:
|nσe_partner|<5 && gMom>0.2
- Pair Cuts:
M_{ee}<0.3 && pairDCA<1.0
